Retention curve, all cohorts (weighted)

How to read

Retention = share of a signup cohort that made a paying transaction (first payment, renewal or upgrade) N months after signup.

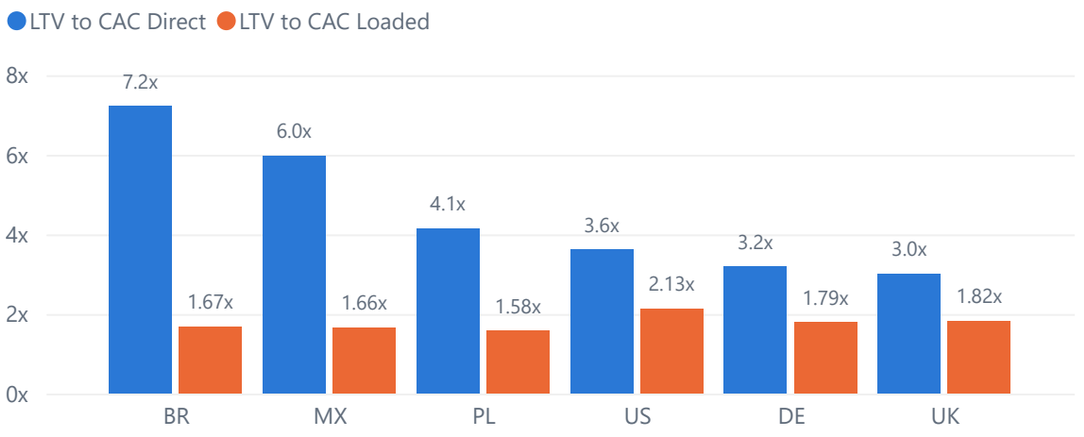

The curve weights each month by cohort size and only uses cohorts old enough to reach that month.

The bump at month 12 comes from annual plans renewing.

Unit Economics

LTV vs CAC by country and channel · direct CAC = country spend, loaded CAC adds the Global overhead

LTV / CAC by country

Refund rate by country (refunds / gross revenue)

Refunded amount by month, USD

Reading the numbers

Refunds take about 0.5% of gross revenue, so they are not a leak worth a project on their own.

Email and Push come with 13% of renewals and 69% of upgrades. The data only links a campaign to a transaction, so this shows association, not proven uplift.

Win-back brought back 223 churned users; 160 of them renewed again afterwards.
