1 About me	2 Elevator pitch	3 Report walkthrough	4 Live demo	5 SQL
35 s · HR part	1 min	6 min	2–3 min · on request	validation query, p. 3 · on request

Key takeaways

1. **Renewals carry the business.** 61.9% of $343.6K net revenue; the biggest loss is the first renewal (64.2% → 49.1%).
2. **Acquisition pays back, but overhead halves the margin.** LTV $68.71 vs direct CAC $18.36 (3.7x); loaded CAC $36.91 (1.86x).
3. **Conversion is a country problem, not a channel problem.** Trial → Paid: US 71.8%, Brazil 55.9%, Mexico 52.7%; channels only 61.7–66.6%.

1 · About me

35 s

I have a degree in finance and experience with Ukrainian accounting software: primary documents, financial reporting and e-reporting. What I enjoyed most was digging into the numbers and explaining them, so I deliberately moved into data analytics. I'm now taking an online data analytics course while working at Helsingør Forsyning. My goal is a Data Analyst role, then Analytics Engineer. Finance gives me a feel for business metrics and the habit of checking whether the data is actually right.

2 · Elevator pitch

1 min

I built an end-to-end analysis of a subscription language-learning app: 5,000 users and 23,000 transactions over 19 months in six countries. I profiled and extracted the data with SQL in DBeaver, built a star-schema model with 65 DAX measures in Power BI, and validated 26 headline numbers back in SQL. All of them match.
Three findings stand out. Renewals bring 62% of revenue, so the first renewal is the most important moment in the customer's life. Acquisition pays back, $68.71 of revenue per user against $18.36 of direct marketing cost, but shared overhead halves that ratio. And trial conversion in Mexico and Brazil is 16–19 points below the US.
I turned that into three recommendations: fix trial conversion in Mexico and Brazil, protect the first renewal, and keep Black Friday discounts shallow.

3 · Report walkthrough

6 min

Executive summary · p. 1 · 20 s

No pitch before? Add: 5,000 users · 23,020 transactions · Feb 2024 – Aug 2025 · 6 countries · 7 channels.

Now the full report. The question behind it is simple: is growth paying back? The short answer is yes: 3.7 times on direct marketing spend, but only 1.86 once shared overhead is included. I'll go page by page and finish with recommendations.

Data and method · p. 2–3 · 50 s

First, how the numbers were produced. The source is a MySQL database: four tables, 28,432 rows. In DBeaver I ran seven data-quality checks; everything was clean, so nothing had to be removed. The only special case is $92,750 of marketing spend marked Global, for SMM and content. It belongs to no country, so I treat it as shared overhead. Then I extracted the four tables with plain SQL and built a star schema in Power BI: two fact tables, transactions and marketing spend, with shared date, country and channel dimensions, and 65 DAX measures on top. Finally, I rebuilt 26 headline numbers independently in SQL. All 26 match Power BI; the validation query is on page 3.

Revenue · p. 4 · 35 s

Net revenue grew from $1.3K in February 2024 to $34.3K in August 2025. The key point is where it comes from: renewals bring 61.9% of the $343.6K total, first payments 27.4% and upgrades 11.2%, minus 0.5% of refunds. So the business now depends on keeping payers, not only on winning new ones. Growth has slowed, though: revenue was flat from November 2024 to February 2025 and has grown only 2–5% a month since April 2025.

Acquisition funnel · p. 5 · 35 s

Two in three trial users become payers: 64%. What drives conversion? Between countries the gap is big: the US converts 71.8%, Brazil 55.9% and Mexico 52.7%. Between channels the spread is narrow, from 61.7% to 66.6%. So weak conversion is a country problem, not a channel problem. If Brazil and Mexico reached the average, that would add about 120 paying users.

Cohort retention · p. 6 · 35 s

Here I group users by signup month and check what share still pays N months later. The biggest drop is right at the start: from 64.2% in the signup month to 49.1% one month later. So the first renewal is where we lose most payers. After that the curve flattens: about 35% are still paying at months 8 to 11.

Unit economics · p. 7–8 · 60 s
I compare LTV, the net revenue per user so far, not a forecast, with CAC, the cost to acquire a user. CAC comes in two versions: direct, with only the country's or channel's own spend, and loaded, which also splits the Global overhead by users. Acquisition pays back in every country, but the ranking flips. On direct spend Brazil leads with 7.2x: users there pay 28% below list price, $10.79 for Monthly, but cost only $5.61 to acquire. With overhead included, the US leads with 2.13x and Poland is last with 1.58x. Overall the ratio falls from 3.7 to 1.86, so overhead decides whether growth is profitable. Among channels, Google Ads brings the most after its own spend and has the best renewal rate, 75.2%. Influencer is the cheapest, but its users are the least valuable.

Deep dive: Black Friday · p. 8–9 · 30 s
One anomaly stands out: Black Friday 2024. November brought 40% more signups, but half of them bought the Annual plan at $30.76 instead of $59.99. The cohort's LTV is only $56.64, against $64–83 for its neighbours, and it's the weakest cohort in retention, 34.2% in month one. Facebook Ads also had a CAC spike in June 2024, but the volumes were too small to matter.

Campaigns · p. 9–10 · 10 s
On campaigns, Win-back brought back 223 users, and 71.7% of them renewed again.

Recommendations and limitations · p. 10 · 40 s
I make three recommendations. One: lift trial conversion in Mexico and Brazil by testing local payment methods and a local price at the end of the trial. Two: protect the first renewal with a reminder before the first charge and a cheaper plan instead of cancellation. Three: keep Black Friday discounts shallow, or limit them to the Monthly plan. Two limitations: LTV is historical, not a forecast, and campaign effects are associations, not proven causes. Thank you. I'm happy to open any number in SQL or Power BI.

4 · Live demo in Power BI

2–3 min · on request

Overview · 20 s
Show: KPI cards → the Renewal Revenue line under Net Revenue → the funnel on the right
This is the overview: $343.6K of net revenue, 5,000 users and 64% trial to paid. The orange line is renewal revenue, and it now carries most of the business. On the right is the funnel, from signup to upgrade.

Users & Funnel · 30 s
Show: Trial → Paid by country (dashed line = 64% average), then Trial → Paid by channel
By country, the dashed line is the 64% average. The US is above it, Mexico and Brazil are well below. By channel, all the bars are close together, so the problem is the country, not the channel.

Retention · 30 s
Show: hover over the 2024-11 row in the matrix, then the curve: drop M0 → M1, bumps at M3 and M12
In the matrix, November 2024 is the weakest cohort: that's Black Friday. On the curve you can see the big drop between month 0 and month 1, and the bumps at months 3 and 12, when Quarterly and Annual plans renew.

Unit Economics · 30 s
Show: country table with CAC Direct and CAC Loaded side by side (BR 7.2x → 1.67x), then the channel table: Google Ads and Influencer
Brazil looks best on direct spend, 7.2x, but with overhead it falls to 1.67x. Among channels, Google Ads brings the most after its own spend and has the best renewal rate. Influencer is cheap, but its users are the least valuable.

Deep Dives · 30 s
Show: Black Friday table (row 2024-11), Facebook Ads CAC line with the June 2024 spike, Monthly price by country
Here are the three anomalies. The November cohort bought cheap Annual plans, the Facebook Ads cost per user spiked in June 2024, and Brazil pays 28% less for the Monthly plan.

Refunds & Campaigns · 15 s
Show: Refund Rate 0.51%, campaigns table (Email + Push = 69% of upgrades), Win-back cards; one sentence, no details
Refunds are only 0.51% of gross revenue. Email and Push come with 69% of upgrades, and Win-back brought back 223 users.

If they ask

Q&A backup

Data quality	7 dimensions: completeness, uniqueness, validity, consistency, accuracy, timeliness, relevance. No duplicate keys, no orphan rows.
Funnel steps	76.6% start a trial, 72% make a first payment, about half renew, 10.7% upgrade. 31.9% of payers paid without a trial.
Retention method	Weighted by cohort size; only cohorts old enough to reach month N; counts payments, because there is no cancellation date. Bumps at M3 and M12 = Quarterly and Annual renewals. A better way: count a user as active for the whole period their payment covers; then the bumps disappear.

Facebook Ads	CAC +49% from spring to summer 2024, peak $65.55 in June, then back to normal → add a CAC alert on paid channels.
Refunds	0.51% of gross revenue, too small to act on.
Email & Push	Come with 69% of upgrades, but there is no control group → test with a holdout group.
Other limitation	This is a training dataset.
LTV per whom?	Per registered user: $343.6K / 5,000 = $68.72. CAC uses the same base, so the comparison is like for like. LTV is revenue, not margin: there is no cost data, so with margin the ratio would be lower.
Why split overhead by users?	It's the simplest neutral rule: brand and content work for every user equally. Splitting by spend or revenue would change the country ranking.
Is 3.7x good?	A common rule of thumb for subscriptions is LTV/CAC ≥ 3. Direct 3.7x is above it, loaded 1.86x is below.
Was Black Friday bad?	Not in total: 40% more users × $56.64 ≈ $79 per user of a normal-size cohort, in line with its neighbours ($64–83). The problem is lower value per user and weaker retention, so the advice is shallow discounts, not cancelling the campaign.
Where do the 120 users come from?	(64% − country conversion) × trial users in that country, for Brazil and Mexico, added together.
Why two fact tables?	Different grain: transactions are one row per payment, marketing spend is one row per date × country × channel. They connect only through the shared dimensions.
What would you do next?	Forecast LTV from the retention curve, get cancellation data, and move the logic into dbt models.
